

PROJECT

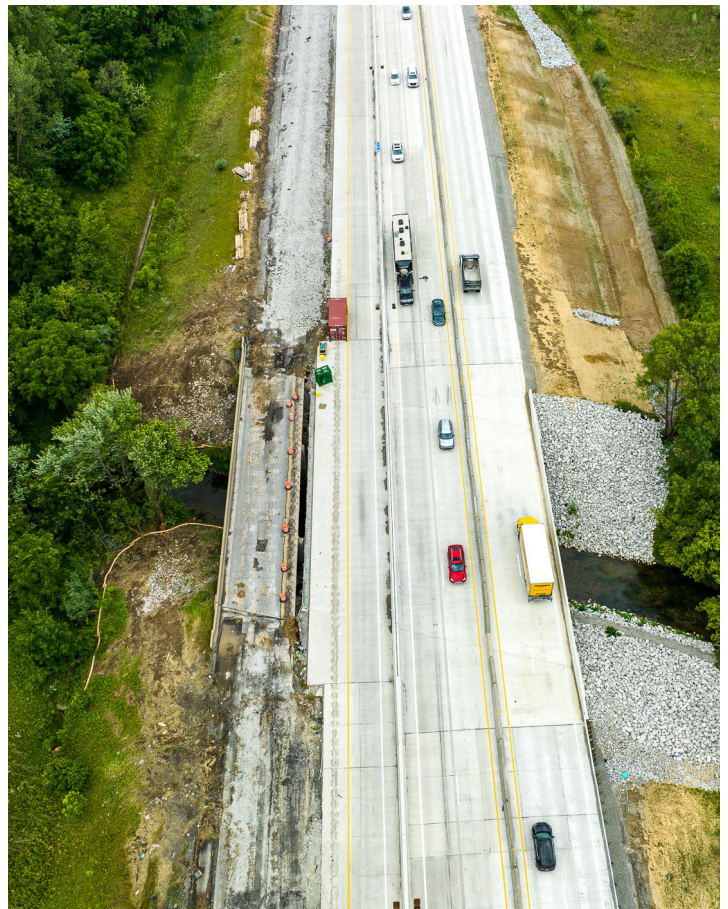

SPOTLIGHT

American Structurepoint is known for pushing innovation and staying at the forefront of technology. Our work on Interstate 65 in Boone County, Indiana, demonstrates how we partner with our clients to innovate while improving the quality of life for the communities we serve.

As a part of the project, American Structurepoint provided engineering design services for added travel lanes and widening along I-65 between SR 32 & SR 47. The Indiana Department of Transportation (INDOT) also wanted to test new pavement designs to see how different sealant treatments and sub-bases functioned over time. Developing better types of pavement can extend the life of a roadway and require less maintenance.

Working alongside INDOT, our team of experts designed four innovative pavement sections using a traditional sub-base and permeable base layers. Using the latest testing technology, INDOT will receive data to see how the pavement performs and which drainage layers in the area can be improved by using the new, innovative pavement designs.

Understanding the bigger picture of a project and our clients' vision is at the core of American Structurepoint's mission. We are proud to join with INDOT to pioneer pathways that improve existing roadways, enhance safety, and fast-track transportation innovation that leads to better outcomes.

AMERICAN STRUCTUREPOINT IS A FULL-SERVICE ARCHITECTURE AND ENGINEERING FIRM.
